3 squares embedded in Sherwood-Czezowski hexagon (SC)

## Introduction: Aristotelian subdiagrams

4 hexagons embedded in Buridan octagon

Logical Geometry of RDH - H. Smessaert

## Introduction: Aristotelian subdiagrams in RDH

Internal structure of bigger/3D Aristotelian diagrams ? Some initial results:

- 4 weak JSB-hexagons in logical cube (Moretti-Pellissier)
- 6 strong JSB hexagons in bigger 3D structure with 14 formulas/vertices
- tetra-hexahedron (Sauriol)
- tetra-icosahedron (Moretti-Pellissier)
- nested tetrahedron (Lewis, Dubois-Prade)
- rhombic dodecahedron $=$ RDH (Smessaert-Demey) $\rightsquigarrow$ joint work

Greater complexity of RDH exhaustive analysis of internal structure ?? Main aim of this talk $\rightsquigarrow$ tools and techniques for such an analysis

- examine larger substructures (octagon, decagon, dodecagon, ...)
- distinguish families of substructures (strong JSB, weak JSB, ...)
- establish the exhaustiveness of the typology

cube $=4 \times \mathrm{L} 1+4 \times \mathrm{L} 3 /$ octahedron $=6 \times \mathrm{L} 2 /$ center $=\mathrm{L} 0+\mathrm{L} 4$

Bitstrings have been used to encode

- logical systems: e.g. classical propositional logic, first-order logic, modal logic and public announcement logic
- lexical fields: e.g. comparative quantification, subjective quantification, color terms and set inclusion relations

Contradiction relation is visualized using the central symmetry of RDH:

- contradictory bitstrings (e.g. 1100 and 0011) occupy diametrically opposed vertices
- the negation of a bitstring is located at a maximal (Euclidean) distance from that bitstring.
- nearly all Aristotelian diagrams discussed in the literature observe central symmetry ("contradictories are diagonals")

Logical Geometry of RDH - H. Smessaert
KULEUVEN

Bitstrings/formulas come in pairs of contradictories (PCD) Key notion in describing RDH is $\sigma_{n}$-structure.

- A $\sigma_{n}$-structure consists of $n$ PCDs
- A $\sigma_{n}$-structure is visualized by means of a centrally symmetrical diagram
- Examples a square has $2 \mathrm{PCDs} \Rightarrow \sigma_{2}$-structure a hexagon has 3 PCDs $\Rightarrow \sigma_{3}$-structure an octagon has $4 \mathrm{PCDs} \Rightarrow \sigma_{4}$-structure a cube has 4 PCDs $\quad \Rightarrow \quad \sigma_{4}$-structure
Remarks
- $1 \sigma$-structure may correspond to different $\sigma$-diagrams:
- alternative 2D visualisations
- 2D versus 3D representations
- All $\sigma$-structures have an even number of formulas/bitstrings
- Nearly all Aristotelian diagrams in the literature are $\sigma$-structures

Original question of Aristotelian subdiagrams ("How many smaller diagrams inside bigger diagram?") can now be reformulated in terms of $\sigma$-structures.

- For $\mathrm{n} \leq \mathrm{k}$, the nummer of $\sigma_{n}$-structures embedded in a $\sigma_{k}$-structure can be calculated as the number of combinations of $n$ PCDs out of $k$ by means of the simple combinatorial formula: $\binom{k}{n}=\frac{k!}{n!(k-n)!}$
- This combinatorial technique $\rightsquigarrow$ recover well-known results:
- \#squares $\left(\sigma_{2}\right)$ inside a hexagon $\left(\sigma_{3}\right)$ is $\binom{3}{2}: \frac{3!}{2!(1)!}=\frac{6}{2}=3$
- \#hexagons $\left(\sigma_{3}\right)$ inside octagon $\left(\sigma_{4}\right)$ is $\binom{4}{3}: \frac{4!}{3!(1)!}=\frac{24}{6}=4$
- This combinatorial technique $\rightsquigarrow$ obtain new results for RDH:
- RDH contains 14 vertices, hence 7 PCDs $\rightsquigarrow \mathrm{RDH}=\sigma_{7}$-structure
- Calculate the number of $\sigma_{n}$-structures inside a $\sigma_{7}$-structure as the number of combinations of $n$ PCDs out of $7:\binom{7}{n}=\frac{7!}{n!(7-n)!}$

| $\sigma_{0}$ | $\sigma_{1}$ | $\sigma_{2}$ | $\sigma_{3}$ | $\sigma_{4}$ | $\sigma_{5}$ | $\sigma_{6}$ | $\sigma_{7}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\binom{7}{0}$ | $\binom{7}{1}$ | $\binom{7}{2}$ | $\binom{7}{3}$ | $\binom{7}{4}$ | $\binom{7}{5}$ | $\binom{7}{6}$ | $\binom{7}{7}$ |
| $\frac{7!}{0!(7)!}$ | $\frac{7!}{1!(6)!}$ | $\frac{7!}{2!(5)!}$ | $\frac{7!}{3!(4)!}$ | $\frac{7!}{4!(3)!}$ | $\frac{7!}{5!(2)!}$ | $\frac{7!}{6!(1)!}$ | $\frac{7!}{7!(0)!}$ |
| $\frac{5040}{1 \times 5040}$ | $\frac{5040}{1 \times 720}$ | $\frac{5040}{2 \times 120}$ | $\frac{5040}{6 \times 24}$ | $\frac{5040}{24 \times 6}$ | $\frac{5040}{120 \times 2}$ | $\frac{5040}{720 \times 1}$ | $\frac{5040}{5040 \times 1}$ |
| 1 | 7 | 21 | 35 | 35 | 21 | 7 | 1 |

- 3 squares in $1 \mathrm{JSB} \times 6 \mathrm{JSB}$ in $\mathrm{RDH}=18$ squares in RDH .

Remaining 3 ?? Unconnected/degenerate squares

- 6 strong JSB +4 weak JSB $=10$ hexagons in RDH.

Remaining 25 ?? Sherwood-Czezowski. Others ? Unconnected4/12.

- symmetry/mirror image ? Complementarity:
$\# \sigma_{0}=\# \sigma_{7}, \# \sigma_{1}=\# \sigma_{6}, \# \sigma_{2}=\# \sigma_{5}, \# \sigma_{3}=\# \sigma_{4}$

(3) Sigma-structures
(4) Families of Sigma-structures: the CO-perspective
(5) Complementarities between families of Sigma-structures
(6) Conclusion

Logical Geometry of RDH - H. Smessaert

## Families of $\sigma_{n}$-structures: the CO -perspective

| rhombic dodecahedron (RDH) | $=$ | cube $(\mathrm{C})$ | + | octahedron (O) |
| :---: | :---: | :---: | :---: | :---: |
| $\sigma_{7}$ | $=$ | $\sigma_{4}$ | + | $\sigma_{3}$ |
| 7 PCDs | $=$ | $4 \mathrm{PCDs} \mathrm{L} 1-\mathrm{L} 3$ | + | $3 \mathrm{PCDs} \mathrm{L} 2-\mathrm{L} 2$ |

Construct a principled typology of families of $\sigma$-structures inside RDH.

- $\sigma_{n}=n$ out of the 7 PCDs of RDH
- $\sigma_{n}=[k$ out of the 4 PCDs of $C]+[\ell$ out of the 3 PCDs of $O]$
- CO-perspective: every class of $\sigma_{n}$-structures can be subdivided into families of the form $C_{k} O_{\ell}$, for $0 \leq k \leq 4 ; 0 \leq \ell \leq 3$ and $k+\ell=n$.
- For example, the cube C is $\mathrm{C}_{4} O_{0}$, and the octahedron O is $\mathrm{C}_{0} O_{3}$.
- The number of $C_{k} O_{\ell}$-structures inside RDH $\left(C_{4} O_{3}\right)$ can be calculated as $\binom{4}{k}\binom{3}{\ell}$.

| $\sigma_{2}$ | $=$ | $C_{2} O_{0}$ | + | $C_{1} O_{1}$ | + | $C_{0} O_{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\binom{7}{2}$ |  | $\binom{4}{2}\binom{3}{0}$ |  | $\binom{4}{1}\binom{3}{1}$ |  |  |
| 21 | $=$ | 6 | + | 12 | + | 3 |

| squares | classical | classical | degenerated |
| :---: | :---: | :---: | :---: |
|  | balanced | unbalanced | (balanced) |
| $2 \times L 1 / 2 \times \mathrm{L} 3$ | $1 \times L 1 / 2 \times \mathrm{L} 2 / 1 \times \mathrm{L} 3$ | $4 \times \mathrm{L} 2$ |  |

| $\sigma_{3}$ | $=$ | $\mathrm{C}_{0} \mathrm{O}_{3}$ | + | $\mathrm{C}_{3} \mathrm{O}_{0}$ | + | $\mathrm{C}_{1} \mathrm{O}_{2}$ |  | $\mathrm{C}_{2} \mathrm{O}_{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\binom{7}{3}$ |  | $\binom{4}{0}\binom{3}{3}$ |  | $\binom{4}{3}\binom{3}{0}$ |  | $\binom{4}{1}\binom{3}{2}$ |  | $\binom{4}{2}\binom{3}{1}$ |
| 35 | $=$ | 1 | + | 4 |  | 12 | + | 18 |

| hexagons | degener. | weak | degener. | strong JSB |
| :---: | :---: | :---: | :---: | :---: |
|  | U12 | JSB | U4 | Sher-Czez |

## Families of $\sigma_{3}$-structures: the isomorphism perspective

- CO-perspective: no distinction strong JSB vs Sherwood-Czezowski
- isomorphism perspective: no distinction strong JSB vs weak JSB

| $\sigma_{0}$ | $\sigma_{1}$ | $\sigma_{2}$ | $\sigma_{3}$ | $\sigma_{4}$ | $\sigma_{5}$ | $\sigma_{6}$ | $\sigma_{7}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | $C_{0} O_{3}$ | $C_{4} O_{0}$ |  |  |  |
|  |  |  | 1 | 1 |  |  |  |
|  | $C_{1} O_{0}$ | $C_{0} O_{2}$ | $C_{3} O_{0}$ | $C_{1} O_{3}$ | $C_{4} O_{1}$ | $C_{3} O_{3}$ |  |
|  | 4 | 3 | 4 | 4 | 3 | 4 |  |
| $C_{0} O_{0}$ | $C_{0} O_{1}$ | $C_{2} O_{0}$ | $C_{2} O_{1} a$ | $C_{2} O_{2} a$ | $C_{2} O_{3}$ | $C_{4} O_{2}$ | $C_{4} O_{3}$ |
| 1 | 3 | 6 | 6 | 6 | 6 | 3 | 1 |
|  |  | $C_{1} O_{1}$ | $C_{2} O_{1} b$ | $C_{2} O_{2} b$ | $C_{3} O_{2}$ |  |  |
|  |  | 12 | 12 | 12 | 12 |  |  |
|  |  |  | $C_{1} O_{2}$ | $C_{3} O_{1}$ |  |  |  |
|  |  |  | 12 | 12 |  |  |  |
| 1 | 7 | 21 | 35 | 35 | 21 | 7 | 1 |

## Structure of the talk

(5) Complementarities between families of Sigma-structures

## Complementarities between families of $\sigma_{n}$-structures

Fundamental complementarity between $\sigma$-structures inside RDH

- $\left|\sigma_{n}\right|=\left|\sigma_{7-n}\right|$
